Spring 2025-2026

E-Learning Platform with Personalized Study Plans
Example Usage Scenario

Group 7

Defne Yılmaz
Hasan Efe Ünal
Can Özer
Ege Yılmaz

A student logs into the web platform using their credentials and begins browsing the available courses in the course catalog. The student filters the courses based on category and difficulty level to find suitable options and selects one that matches their interests. After selecting the course, the student sends an enrollment request, which is then reviewed by an admin through the desktop application. Once the admin approves the request, the student gains access to the course modules and starts completing them one by one, marking each as completed. The system continuously tracks the student's progress and displays the completion percentage. As the student progresses, the system analyzes the enrolled courses, performance, and ECTS workload to generate a personalized study plan that ensures a balanced learning schedule. Additionally, the system uses delegates to dynamically recommend new courses based on learning preferences and past activity. Meanwhile, the admin monitors student progress, analyzes course metrics such as enrollment and completion rates, and manages course content through the desktop interface. All data is stored in a shared SQLite database, ensuring consistency between the web and desktop applications.
